

# Salifort Motors Attrition Analysis

## Analysis & Retention Strategy in Salifort Motors

---

### Overview

Salifort Motors is a fictional French-based alternative energy vehicle manufacturer. The company researches, designs, constructs, validates, and distributes electric, solar, algae, and hydrogen-based vehicles.

### Objective

Salifort Motors is facing high employee turnovers. The objective for this analysis is to:

1. Analyze the provided HR dataset to understand the factors behind employee turnover
  2. Recommend key actions to remediate employee retention based on the data analysis
  3. Design a model that predicts attrition
- 

### Results

Key findings:

- Attrition is driven mainly by underutilization and overutilization of employees
- Severe overworking employees is the biggest turnover count
- Severe lack of internal mobility amplifies attrition

Model construction:

Due to ethical concerns and dataset limitations, a reliable model cannot be constructed. This is because:

- Elements of employee exploitation is present. Remediation is priority
- Dataset does not provide the full context necessary for model construction

Overall, this dataset risks constructing a model that profiles employees based on their productivity without the appropriate context.

---

### Next Steps

We recommend revising overtime policies, managerial accountability, and the internal progression ladder to improve retention. A longitudinal analysis will help make better decision making for policy revision
